

Report your timber for measurement with the sScale™ StackSnap mobile app

- Photo-register timber stacks immediately when needed.
- Send the stack location and information to the sScale™ admin module registration queue, and further on to the sScale™ mobile unit operator for measurement.
- Report hand measurement data - i.e. for a few logs of high value timber.
- Document and report the rear side of stacks when needed.

With the sScale™ StackSnap mobile app, you can record each timber stack on the fly, and put the timber stack in the queue for measurement by the sScale™ mobile Unit.

The app provides instant photo documentation of the timber stack, and gives you a new and flexible way of registering and documenting stacks.

The app supplements the sScale™ administration module and helps to feed stack data to the sScale™ mobile unit which takes care of the stack measurements.

For small stacks, or in case of need, you may however choose to use the app to report your own volume estimate of the stack.

The app is available as a demo on Google play and will be made accessible for Dralle customers.

With Dralle systems you are sure to get your timber measured on time.
